

1Sapce: CPIMS issues to fix – Sep, 2023

1. Sorting project list: fix sorting by each attribute
2. View full project name when hovered on the project name, on view project
3. View project history: doesn't fetch encoded history data. It has to display before we click edit (make sure for all history data)
4. When we click the " back" button from view project page, it should go back to project list
5. Project filter: it doesn't work for summary page. Make sure it filters for analysis and the remaining tabs
6. View project plan page takes more time, check it's speed
7. On project plan and report, change "June/2021" to June/ 2023
8. When we save project history, the page jumps out. It needs to stay on project history page and show saved data.
9. Check project duration % (the calculation is wrong)
10. Calculate project duration from entering commencement date and completion date.
